

Description

Pedestal made of high-durability plastic material (base and cover - PE, body - PVC, handle - PE) with concrete-filled base (weight approx. 23kg) and metal hooks for fixing chains or isolation bars (for this purpose we recommend a maximum distance of 6 meters between the pedestals). It also has straps for mounting of the siding screen with a recommendation of a maximum distance of 4 meters between pedestals for this use. For the transportation of this assembly, there is a molded polyethylene handle developed to meet all the ergonomic and safety requirements for such use.

Application

Signaling and guidance of flows of people and vehicles, isolation and demarcation of areas, indoors and outdoors, on any type of floor, and as the best support developed in the market for the use of the siding screen.

Differentials

A one-piece, weatherproof, stainless, one-piece base (no cover at the bottom) that allows the use of the siding screen in environments where the floor must be kept intact during isolation.
